## 1 Adding custom Headerlines to an Email with Mozilla

Ever wondered how to add a custom header into an Email? A normal Email-hedaer looks something like

```
From: Peter Schwarz <pschwarz@white.com>
To: His Majesty <his@majesty.com>
Subject: i think qmail is a good mailer
Date: Fri, 27 Jun 2003 16:18:56 +0200
Message-ID: <ASDLFKJHASDLFKJASDFASDFLKJASDH.pschwarz@white.com>
```

And now you would like to add an additional Header like

```
X-Info: www.mydomain.com
```

or just

```
Outlook-users-are: dumb
```

(You actually don't need to add an 'X-' before the string.)

The solution:

Close all your Mozilla instances and cd to your Mozilla Directory.

```
# cd ~/.mozilla/myprofile/.2432sdf.slt/
```

Edit *prefs.js* and add the follwing line:

```
user_pref("mail.compose.other.header", "[add here all additional header in a comma separ
```

E.g.:

```
user_pref("mail.compose.other.header", "X-Info,Outlook-users-are,X-Accept-No-Word-docs".
```

Start Mozilla and the mailwindow of Mozilla and compose a new Mail. Enter the desired Emailaddress into the 'To:' field and press 'Enter'. Now you can choose all your X- and other funny headers! WOW!

Since Mozilla rewrites *prefs.js* every time it quits, you have to write to this file, while Mozilla sleeps calm. Otherwise you can edit the file *user.js* while Mozilla is awake and after that restart Mozilla. Mozilla will read the *user.js* and append its content to *prefs.js*.

To Edit all your Mozilla Config while running Mozilla, open the Browser and in the address line enter:

`about:config`

You can search now for

`mail.compose.other.header`

doubleclick the line and edit your headers.
